Jodhvir Singh:

1. Walk out of the class on either door and turn left into the hallway
2. Turn right when you see the exit doors
3. Exit out of the building from the front. (Make sure you see the clocktower)
4. Walk straight and turn right on the next path you see
5. Straight ahead there should be a building to the left that has an anchor and the number 3010
6. Turn left into the pathway of the building
7. Walk into the building and you are at the library

Rayyan:

1. Walk out of class through one of the two doors and turn right
2. Walk straight and then exit the building at the farthest set of doors
3. Walk straight on the path until u get to the four-path intersection
4. Turn left and walk straight until the tree intersection
5. Take the right path and continue going straight
6. Upon seeing the building with the library, walk up the stairs and enter

Vraj Desai:

1. Walk out either of the two doors of class and take a left
2. Head straight for about 20-30 ft and you shall find the exit doors to your right
3. Then head out the exit doors and once you walk out you will see a tall clock tower
4. Once you see that clock tower head straight towards it and do not be afraid to walk on the grass
5. Once you are at the clock tower turn right and you shall see a building with a giant anchor outside
6. Once you see the anchor walk to the anchor and thus behind the anchor you shall see doors and inside of them is the library

Chase:

1. Walk outside of the classroom, as you exit you should be facing forward, then you will turn left and walk in that direction for 20 ft.
2. As you stop after walking 20ft you should see two glass doors to your right you will then exit those doors.
3. As you exit the first thing you should notice is a clock tower, make your way to the clock tower in the same direction you first saw it.

4. Now from your position turn 90 degrees right and head straight until you reach a building with the numbers 3010 on it youll know for sure its the right spot if you see an anchor.
5. Enter the building through the doors and you will be in the library

Questions:

a. Which set of the four sequence steps did you identify as being the best? Why?
We identified Vraj's sequence steps as the best; His steps were very specific and easy to follow.

b. In what ways were the sets of sequences that were produced different?
Some parts of the set of sequences were different such as walking out of the class and turning left or right, mentioning the clock tower, and providing estimated measurements. Even though the sets of sequences were different, all of the steps lead to the same place.

c. In what ways were the sets of sequences produced the same?
Each set of sequences had a similar base for each step such as walking out of the class, exiting out the building, etc. Some also used similar key monuments to signify that the path they were on is current, specifically the anchor. They all of course had the same goal being to end up at the library.

d. Consider whether your choice of which of these would be the best set of instructions might change depending on the person following them. For example (you may think of other examples), would the best-set change if:

i. The person following them was already familiar with or had never set foot on Campus.
Yes it would change because the person familiar with the campus already knows where most places are and can use them as relative landmarks.

ii. The person following the instructions was using a wheelchair, or the person following the instructions was interested in jogging.

Yes we would change the instructions to better accommodate someone with a disability as the instructions was curated for someone who can walk normally

iii. The person was in a rush to get to the library or was a visitor interested in getting the best overall feel of campus while traveling to the library.

Yes, it would change for a person in a rush as fewer, more general instructions with key specific details would be better than multiple instructions

Briefly describe whether different sets of instructions might have been better options in other scenarios.

e. This was a very open-ended question. What questions might you have asked to begin with in order to know better how your sequential steps should have been written?
i. The point here is to help you understand the importance of gathering requirements at the first stage of attacking a problem – make sure you are solving the problem someone needs, rather than the one you want to solve.

One question we have is that at what point are the steps too detailed because at some point common sense should play a part hence shortening the given directions.

Activity #2:

Measurements: Time, Constant Speed, Position

Velocity = distance/time

Speed = (615-50)/(45-30)

Speed = 113/3

Linear equation:
Y = 113/3x + 0
